

Basic Life Support and Automated External Defibrillation (AED) adapted for COVID-19

 **For trained healthcare providers**

 **Bag-mask Ventilation:** use a 2-person technique (one person to provide mask seal, the other person provides compressions & also gives the ventilations); put a viral filter between bag & mask.

 *BLS teams less skilled or uncomfortable with bag-mask ventilation should place an oxygen mask on the patient's face, give oxygen and provide compression-only CPR*
